

Problem 1

Show that the assumption that $\mathbb{P}$ is countably additive is equivalent to the assumption that $\mathbb{P}$ is continuous. That is to say, show that if a function $\mathbb{P} : \mathcal{F} \rightarrow [0, 1]$ satisfies $\mathbb{P}(\emptyset) = 0$, $\mathbb{P}(\Omega) = 1$, and $\mathbb{P}(A \cup B) = \mathbb{P}(A) + \mathbb{P}(B)$ whenever $A, B \in \mathcal{F}$ and $A \cap B = \emptyset$, then $\mathbb{P}$ is countably additive (in the sense of satisfying Definition (1.3.1b)) if and only if $\mathbb{P}$ is continuous (in the sense of Lemma (1.3.5)).

Proof. • $\Rightarrow$ Suppose $\mathbb{P}$ is countably additive.

Suppose w.l.o.g. that $\{A_n\}_{n=1}^{+\infty}$ be any increasing sequence of events and $A_1 \subset A_2 \subset \dots$

Let $A = \bigcup_{n=1}^{\infty} A_n$

Let $B_1 = A_1, B_2 = A_2 \setminus A_1, \dots, B_n = A_n \setminus A_{n-1}$ and they are all disjoint

Then

$$A = \bigcup_{n=1}^{\infty} B_n = \bigcup_{n=1}^{\infty} A_n$$

For every n , we have $A_n = \bigcup_{k=1}^n B_k$

By countable additivity, we have $\mathbb{P}(A_n) = \sum_{k=1}^n \mathbb{P}(B_k)$

Then, we have $\mathbb{P}(A) = \mathbb{P}(\bigcup_{k=1}^{\infty} B_k) = \sum_{k=1}^{\infty} \mathbb{P}(B_k)$

So,

$$\lim_{n \rightarrow \infty} \mathbb{P}(A_n) = \lim_{n \rightarrow \infty} \sum_{k=1}^n \mathbb{P}(B_k) = \sum_{k=1}^{\infty} \mathbb{P}(B_k) = \mathbb{P}(A)$$

Thus, $\mathbb{P}$ is continuous from below. (similarly we can prove that $\mathbb{P}$ is continuous from above by assuming decreasing $\{A_n\}_{n=1}^{+\infty}$)

• $\Leftarrow$ Suppose $\mathbb{P}$ is continuous.

Let $\{A_n\}_{n=1}^{\infty}$ be a sequence of pairwise disjoint sets in $\mathcal{F}$. Define $B_n = \bigcup_{k=1}^n A_k$.

Then $\{B_n\}_{n=1}^{\infty}$ is an increasing sequence with $\bigcup_{n=1}^{\infty} B_n = \bigcup_{n=1}^{\infty} A_n$.

By continuity, $\mathbb{P}(\bigcup_{n=1}^{\infty} A_n) = \lim_{n \rightarrow \infty} \mathbb{P}(B_n)$. Since the A_n are pairwise disjoint, $\mathbb{P}(B_n) = \sum_{k=1}^n \mathbb{P}(A_k)$.

Thus,

$$\mathbb{P}\left(\bigcup_{n=1}^{\infty} A_n\right) = \lim_{n \rightarrow \infty} \sum_{k=1}^n \mathbb{P}(A_k) = \sum_{n=1}^{\infty} \mathbb{P}(A_n).$$

This shows that $\mathbb{P}$ is countably additive.

□

Problem 2

The 'ménages' problem poses the following question. Some consider it to be desirable that men and women alternate when seated at a circular table. If n heterosexual couples are seated randomly according to this rule, show that the probability that nobody sits next to his or her partner is

$$\frac{1}{n!} \sum_{k=0}^n (-1)^k \frac{2n}{2n-k} \binom{2n-k}{k} (n-k)!$$

You may find it useful to show first that the number of ways of selecting k non-overlapping pairs of adjacent seats is $\binom{2n-k}{k} 2n(2n-k)^{-1}$.

Proof. Assume we have n couples labelled $1, 2, \dots, n$. Define

$$A_k = \{\text{couple } k \text{ sits together}\}.$$

For any chosen k -tuple $(i_1, i_2, \dots, i_k)$, we wish to count

$$\mathbb{N}\left(\bigcap_{j=1}^k A_{i_j}\right).$$

To eliminate rotational symmetry, choose a couple not among $\{i_1, \dots, i_k\}$ (say the one with the smallest index not chosen) and fix its man in seat 1. Since men and women alternate, the problem reduces to selecting k non-overlapping adjacent seat pairs from $2n$ seats. This is equivalent to choosing k "compressed" positions from $2n - k$ spots, which can be done in

$$\binom{2n-k-1}{k} \text{ ways.}$$

Next, assign the k couples to these pairs in $k!$ ways. The remaining $n - k - 1$ men and $n - k$ women are arranged in $(n - k - 1)!(n - k)!$ ways. Including the initial factor $2n$ from the possible choices before fixing, we have

$$\mathbb{N}\left(\bigcap_{j=1}^k A_{i_j}\right) = 2n \binom{2n-k-1}{k} k! (n - k - 1)!(n - k)!.$$

Using the inclusion-exclusion principle, the probability that no couple sits together is

$$\mathbb{P}\left(\bigcap_{j=1}^n A_j^c\right) = 1 - \mathbb{P}\left(\bigcup_{j=1}^n A_j\right) = \sum_{k=0}^n (-1)^k \binom{n}{k} \mathbb{P}\left(\bigcap_{j=1}^k A_{i_j}\right).$$

Substituting the count and dividing by the total number of arrangements, we obtain

$$\mathbb{P}\left(\bigcap_{j=1}^n A_j^c\right) = \frac{1}{n!} \sum_{k=0}^n (-1)^k \frac{2n}{2n-k} \binom{2n-k}{k} (n-k)!.$$

□

Problem 3

The probabilistic method. 10 per cent of the surface of a sphere is coloured blue, the rest is red. Show that, irrespective of the manner in which the colours are distributed, it is possible to inscribe a cube in S with all its vertices red.

Proof.

□

Problem 4

Poker. During a game of poker, you are dealt a five-card hand at random. With the convention that aces may count high or low, show that:

$$\mathbb{P}(1 \text{ pair}) \simeq 0.423,$$

$$\mathbb{P}(\text{straight}) \simeq 0.0039,$$

$$\mathbb{P}(4 \text{ of a kind}) \simeq 0.00024,$$

$$\mathbb{P}(2 \text{ pairs}) \simeq 0.0475,$$

$$\mathbb{P}(\text{flush}) \simeq 0.0020,$$

$$\mathbb{P}(3 \text{ of a kind}) \simeq 0.021,$$

$$\mathbb{P}(\text{full house}) \simeq 0.0014,$$

$$\mathbb{P}(\text{straight flush}) \simeq 0.000015.$$

Proof.

$$|\Omega| = \binom{52}{5}$$

$$|1 \text{ pair}| = 13 \times \binom{4}{2} \times \binom{12}{3} \times 4^3$$

$$P[1 \text{ pair}] = \frac{13 \times \binom{4}{2} \times \binom{12}{3} \times 4^3}{\binom{52}{5}} \approx 0.423$$

$$|\text{Straight}| = 10 \times (4^5 - 4)$$

$$P[\text{Straight}] = \frac{10 \times (4^5 - 4)}{\binom{52}{5}} \approx 0.0039$$

$$|4 \text{ of a kind}| = 13 \times (52 - 4)$$

$$P[4 \text{ of a kind}] = \frac{13 \times 48}{\binom{52}{5}} \approx 0.00024$$

$$|2 \text{ pairs}| = \binom{13}{2} \times \binom{4}{2}^2 \times 11 \times 4$$

$$P[2 \text{ pairs}] = \frac{\binom{13}{2} \times \binom{4}{2}^2 \times 11 \times 4}{\binom{52}{5}} \approx 0.0475$$

$$|Flush| = 4 \times \binom{13}{5} - 4 \times 10$$

$$P[Flush] = \frac{4 \times \binom{13}{5} - 4 \times 10}{\binom{52}{5}} \approx 0.0020$$

$$|3 \text{ of a kind}| = 13 \times \binom{4}{3} \times \binom{12}{2} \times 4^2$$

$$P[3 \text{ of a kind}] = \frac{13 \times \binom{4}{3} \times \binom{12}{2} \times 4^2}{\binom{52}{5}} \approx 0.021$$

$$|FullHouse| = 13 \times \binom{4}{3} \times 12 \times \binom{4}{2}$$

$$P[FullHouse] = \frac{13 \times \binom{4}{3} \times 12 \times \binom{4}{2}}{\binom{52}{5}} \approx 0.0014$$

$$|Straightflush| = 10 \times 4$$

$$P[Straightflush] = \frac{10 \times 4}{\binom{52}{5}} \approx 0.000015$$

□

Problem 5

Let m be Lebesgue measure on $[0,1]$, and $0 \leq a \leq b \leq c \leq d \leq 1$ such that $a + d \geq b + c$. Give an example of a sequence of sets $A_1, A_2, \dots$ in $[0,1]$, such that $m(\liminf_n A_n) = a$, $\liminf_n m(A_n) = b$, $\limsup_n m(A_n) = c$ and $m(\limsup_n A_n) = d$.

Proof.

□

Problem 6

Let $\Omega = \mathbb{R}$ and consider the following subsets of $\mathcal{P}(\mathbb{R})$:

$$\mathcal{C}_1 := \{(-\infty, b] : b \in \mathbb{R}\}$$

$$\mathcal{C}_2 := \{(a, b] : a, b \in \mathbb{R}\}$$

$$\mathcal{C}_3 := \{A \subset \mathbb{R}, A \text{ is closed}\}.$$

Show that $\sigma(\mathcal{C}_1) = \sigma(\mathcal{C}_2) = \sigma(\mathcal{C}_3)$.

Proof. $\sigma(\mathcal{C}_1) = \sigma(\mathcal{C}_2)$

- $C_1 \subseteq \sigma(C_2)$
 Since $(-\infty, b] \in \sigma(C_2)$
 So, $\sigma(C_1) \subseteq \sigma(C_2)$ because $\sigma(C_1)$ is minimal
- $C_2 \subseteq \sigma(C_1)$
 Writing $(a, b] = (-\infty, b] \setminus (-\infty, a]$
 Since $(-\infty, b]$ and $(-\infty, a]$ are in C_1 , we have $(a, b] \in \sigma(C_1)$
 So, $\sigma(C_2) \subseteq \sigma(C_1)$ because $\sigma(C_2)$ is minimal

$$\sigma(C_2) = \sigma(C_3)$$

- $\sigma(C_2) \subseteq \sigma(C_3)$: Let $(a, b] \in C_2$. Notice that for any $x \in \mathbb{R}$, the set $(-\infty, x]$ is closed. Hence, both $(-\infty, b]$ and $(-\infty, a]$ belong to C_3 . Writing $(a, b] = (-\infty, b] \setminus (-\infty, a]$, we conclude that $(a, b]$ is an element of $\sigma(C_3)$. Therefore, $C_2 \subseteq \sigma(C_3)$. So $\sigma(C_2) \subseteq \sigma(C_3)$ because $\sigma(C_2)$ is minimal
- $\sigma(C_3) \subseteq \sigma(C_2)$: Every open set $U \subset \mathbb{R}$ can be written as $U = \bigcup_{n=1}^{\infty} I_n$, where each I_n is an open interval. For any open interval $I_n = (a, b)$, we have

$$(a, b) = \bigcup_{m=1}^{\infty} \left(a + \frac{1}{m}, b \right].$$

Thus,

$$U = \bigcup_{n=1}^{\infty} \bigcup_{m=1}^{\infty} \left(a_n + \frac{1}{m}, b_n \right],$$

showing that U is a countable union of half-open intervals of the form $(a, b]$.

Hence, $U \in \sigma(C_2)$, where $C_2 = \{(a, b] : a, b \in \mathbb{R}\}$.

So we have $U^c \in \sigma(C_2)$, where $U^c = C_3$

Therefore, $\sigma(C_3) \subseteq \sigma(C_2)$ because $\sigma(C_3)$ is minimal

□
